Omnilux light therapy can be used for anti-ageing, wrinkle reduction/skin rejuvenation and acne (mild to moderate)

How Does Omnilux Work?

Omnilux works with the body's own natural processes to counteract the effects of ageing and clears acne-prone skin. Omnilux features three interchangeable LED light treatment heads, each with a different colour of light, or wavelength; each head has up to 1700 evenly-spaced diodes which emit a specific narrow band wavelength of light that is proven effective for the condition being treated. Using different combinations of the LED treatment heads means that effective treatment protocols can be delivered for acne, skin rejuvenation and for the reduction of periorbital wrinkles.

What Can I Expect From Omnilux LED Light Treatments?

It depends on the specific condition of the skin you need to treat. Skin rejuvenation treatments using red and near infrared light will have a significant effect on periorbital wrinkles, will help to reduce pore size, improve skin tone and texture, and give a vibrant, healthier-looking skin. Combining blue and red helps remove the bacteria that cause the redness and inflammation of acne, helping to minimise the redness of acne lesions, promoting healing and thus giving clearer and healthier skin.

Why Choose Omnilux?

Unlike any other light therapy device on the market, Omnilux is based on many years of medical research. The efficacy and safety of Omnilux is very well documented in over 60 peer-reviewed publications. This ensures you have powerful results.

Light Colour	Benefits	Product
Blue	Kills acne bacteria	Omnilux Blue
Red	Stimulates collagen Formation. Anti-Inflammatory	Omnilux Revive
Near-infrared	Stimulates collagen. Promotes healing of Tissue.	Omnilux Plus

Acne Light Therapy Treatment

One of the key bacteria responsible for the inflammation is Propionibacterium acne or P.acnes. This bacterium produces natural chemicals called porphyrins, which are sensitive to light at different wavelengths. Omnilux Blue light neutralises the bacteria that causes the redness and inflammation of acne. Combined with the anti-inflammatory properties of Omnilux Red, it helps to minimise the redness of acne lesions and promotes healthier skin. Optimum results will be seen 4-8 weeks after treatment. The light stimulates natural processes that go on after the treatment has stopped. Studies have shown on average you should expect 70-80% of acne lesions to clear.

Anti-Ageing Light Therapy Treatment

Light therapy is very effective as it helps to activate your skin's natural renewal system to reverse the effects of ageing while restoring a younger and healthier appearance. The initial effects are a clearer, brighter and smoother complexion. After the course of treatments you will begin to notice an improvement in tone, clarity and texture. Studies have shown over 80% of subjects reported a softening of fine lines and 75% reported improvement in skin softness and smoothness.
